

Securing the world's most valuable catalogue on Bitcoin

A proposal to anchor authenticity, rights, and durable distribution for Universal Music masters.

Universal Music's catalogue is among the most valuable cultural assets in the world. Its long-term value rests on three things: proving a master is authentic, controlling who can use it, and distributing it without surrendering ownership of the rails. Xtrata is infrastructure that secures all three — anchoring authenticity and rights to Bitcoin while keeping masters encrypted, controlled, and durably distributable.

Authenticity, anchored to Bitcoin

Every master receives a permanent cryptographic fingerprint recorded on Bitcoin via Stacks — a tamper-evident chain of custody proving a recording is the genuine UMG master. As AI makes audio forgery trivial, verifiable authenticity becomes a core catalogue asset.

Programmable rights & transparent royalties

Ownership, licences, and royalty splits are encoded on-chain and settle automatically in Bitcoin. Payments are transparent and auditable in real time, cutting reconciliation friction and disputes.

Control, not exposure

Masters are encrypted by default and never publicly downloadable. Access is granted, time- and territory-bound, and instantly revocable; takedown is enforced cryptographically. UMG holds the keys.

Durable distribution

Content is stored redundantly across resilient networks and addressed by content hash, so it cannot be silently altered or quietly lost — and can feed authorised players and streaming experiences directly.

How it works

01 Ingest & fingerprint

Each master is cryptographically fingerprinted, creating its permanent authenticity anchor.

02 Encrypt & store

The master is encrypted, split, and stored redundantly across multiple resilient networks — never in the open.

03 Anchor rights on Bitcoin

Ownership, licences, and royalty splits are recorded on Stacks and anchored to Bitcoin.

04 Distribute & settle

Authorised players stream from the network; royalties settle automatically in Bitcoin, in real time.

Encrypted by default

Revocable & territory-aware

UMG holds the keys

Why now

AI-era authenticity, accelerating institutional Bitcoin adoption, and the strategic value of owning distribution rather than renting it make this the moment to establish verifiable, Bitcoin-anchored provenance for the world's most important catalogue.

The proposal — a focused pilot

Ingest a defined catalogue slice and demonstrate, end to end: authenticated storage, access-controlled streaming, automated royalty settlement in Bitcoin, and cryptographic takedown — while we jointly define a key-custody model that keeps ultimate control with UMG. The pilot is low-risk by design: masters stay encrypted, access stays revocable, and ownership stays with UMG throughout.
